

Hinged Versa & Flange Mounts

#EZC-VMBH & #EZC-FMBH | Fleet managers and owner-operators seeking **greater hose clearance** between their tractor and trailer now have a new mounting option from EZ Claw. The **Hinged Versa and Flange Mounts feature a reinforced hinge assembly that pivots 45 degrees in either direction, providing added flexibility** during tight turns and backing maneuvers.

Engineered to **reduce pinch points and line restrictions**, this added range of motion complements the hose travel already delivered by the Line Saver. The pivoting design is ideal for shorter wheelbase tractors and works when installed on the back of cab or on a headache rack.

Product Specifications

Benefits/Best Use Cases

Hinged Mount

Pivot point mount allows stainless steel cable to travel the natural path of the hose and cable lines, reducing friction on the cable at the connection point.

Line Protection

Tensioner positioning prevents premature wear from rubbing on hydraulic and electric lines between the truck and the trailer.

Prevent DOT Fines

Maintains compliance by keeping lines and hoses supported above the catwalk and prevents chafing.

Safety

Promotes overall driver safety by eliminating trip hazards on the catwalk.

Tensioner Travel

Hinged bracket allows tensioner to pivot up to 45 degrees in either direction to keep the cable centered in the roller guide during sharp turns.

Spacial Considerations

Setup is ideal for trucks with shorter wheelbases or when the trailer nose (i.e. reefer shroud) encroaches on the space between the cab and trailer.

Weatherproof Construction

Stainless steel components have been salt spray tested to withstand corrosion.

Mounting Options

- **Direct/back of cab mount** for air and electric applications.
- **Headache rack mount** application for air, electric and hydraulic applications.
- **Bulk trailer or tanker applications** where hydraulic lines remain with the trailer when detached.
